

Ellenby Technologies Introduces KP4 Interface to their Smart Safe Product Family
WOODBURY HEIGHTS, N.J. (PRWEB) June, 2019

Ellenby Technologies, Inc. has released their latest enhancement to their smart safe products, a smart soft-touch user interface incorporating an encrypted wireless radio and iButton reader. This interface presents the best of both worlds - tremendous robustness and simplicity at the safe as well as expansion to rich user interface experiences with compatibility to smart phones and tablets.

The all new CashTrak Keypad 4 (KP4), brings a new security interface and adds features that incorporate Cash in Transit services as well as third party cloud-based services all incorporated in a wireless tablet.

The KP4 enables interfacing to our CashTrak safes one of four ways:

1. Highly robust keypad interface
2. iButton™ key reader for compatibility with legacy Cash-in-Transit operations
3. Wireless key fob for automatic authentication of personnel in immediate proximity of the safe
4. Remote tablet app with graphical safe user interface

The all new KP4 will greatly improve the user experience within the store by incorporating the user interface with online services. The remote tablet platform will also allow safe solution providers to white-label and customize their own applications which may include interactive help and information tools, change order request forms, and online dashboards. Aaron Dobbins, President for Ellenby Technologies noted "We have listened to our customers and have invested in technology to fold our smart safes deep into our customers operation."

Ellenby will demonstrate the all new KP4 at the Independent Armored Car Association annual conference in Broomfield, CO June 22-23, 2019.
